

Add a new Bundle and Feature

See also some newer [slides](#)

Sometimes it is necessary to add a new bundle to odysseus, e.g. for new functionality that is not covered yet or does not fit into other bundles.

Create name (must be unique inside an Odysseus installation!)

Location:

Recommendation: Place bundle in one of the given subfolders:

- common: For shared classes between client and server
- client: Only for client, dependency only to common & resources
- monolithic: client and server together (no remote working)
- server: server components, dep. only to common & resources
- wrapper: special server component, dependencies to common, resources, server allowed

- resources: place resources not available on target platform here

Use standard OSGi framework
