

Project operator

Reduces the input object to the given attributes. Makes no duplicate elimination.

Either "attributes" or "paths" parameter has to be set.

Parameter

- `attributes`: A list of attribute names to project on.
- `paths`: A list of paths to project on. Is only used for [key value](#) objects.

Example

PQL

Project Operator

```
output = PROJECT({
    attributes = ['auction', 'bidder']
}, input)
```

CQL

Project Operator

```
SELECT auction, bidder FROM input
```
