

Systemload Feature

With this feature, different hardware measurements are available inside Odysseus.

This feature is named: `de.uniol.inf.is.odysseus.systemload.feature.feature.group`

Systemload uses [OSHI](#) as base for measurements.

The following values are available (TODO):

Systemload add some information to the [rest information service](#) endpoint:

- http://localhost:8888/services/information/systemload_cpu: The current cpu information
- http://localhost:8888/services/information/systemload_mem: The current memory information
- http://localhost:8888/services/information/systemload_net: The current net information

The content is directly delivered from OSHI as shown in this [examples](#).
