

CSV protocol handler

The CSV protocol handler parses delimiter separated text lines.

For performance reasons: If your input does not contains strings with a delimiter (i.e. there are escaped strings) you should use [SimpleCSV protocol handler](#), which is much faster!

Important: Each CSV-line must end with a newline! Especially important when not using a file for input but e.g. [TCP Server transport handler](#) or [AMQP / RabbitMQ transport handler](#).

Options

- **delay:** Delay of reading in milliseconds (default 0). DEPRECATED: use `scheduler.delay` instead if not used together with `delayeach`
- **nanodelay:** Delay of reading in nanoseconds (default 0).
- **delayeach:** The number of lines between a delay is used (default 0).
- **readfirstline:** Should the first line of the file be ignored (e.g. because of header information) (default: true)
- **debug:** If set to true, some additional thinks are available: (default false)
- **dumpEachLine:** Dumps lines to the console. if set to 1 each line will be dumped
- **measureEachLine:** Measures the processing time between n elements that are dumped
- **maxLines:** Stop processing after n elements are read
- **csv.delimiter:** The delimiter for splitting the input (Default: ,).
- **csv.textDelimiter:** The delimiter for strings (Default: "). Inside of strings, `csv.delimiter` is ignored.
- **addlinenumber:** Adds the line number (starting with 0) to the beginning of the line. Remember to add a proper attribute to the schema! (default false).
- **csv.floatingFormatter:** If used for writing, **each double/float** value will be formatted using this formatter (default null). See <https://docs.oracle.com/javase/7/docs/api/java/text/DecimalFormat.html>
 - This option can also be used for reading.
 - This option can be used together with:
 - **decimalseparator:** How is the fraction of the number separated. E.g. for reading german formatted doubles you must use something like: `['csv.floatingformatter', '#,##'], ['decimalseparator', ',']`
 - **exponentseparator:** typically E
 - **groupingseparator:** Typically ",.". In german this is "."
- **csv.numberFormatter:** If used for writing, each number **other than double/float** value will be formatted using this formatter (default null). See <https://docs.oracle.com/javase/7/docs/api/java/text/DecimalFormat.html>
- **csv.trim:** Removes leading and trailing whitespaces in each element (default false)
- **nullvaluetext:** The representation of null values, e.g. '<NULL>' (Default: "")
- **csv.writeheading:** Writes the schema as header of the csv, if set to true (Default: false)

Example

PQL

CSV Protocol Handler

```
input = ACCESS({
    source='fridgeVibrationCSV',
    wrapper='GenericPull',
    transport='File',
    protocol='CSV',
    datahandler='Tuple',
    options=[
        ['delimiter', ','],
        ['textDelimiter', ""],
        ['readfirstline', 'true'],
        ['delay', '100'],
        ['filename', 'path to file']
    ],
    schema=[
        ['description', 'Double']
    ]
})
```

CQL

CSV Protocol Handler

```
CREATE STREAM csv (symbol String, points Double)
  WRAPPER 'GenericPush'
  PROTOCOL 'CSV'
  TRANSPORT 'File'
  DATAHANDLER 'Tuple'
  OPTIONS ( 'delimiter' ',', 'textDelimiter' '"', 'readfirstline' 'true', 'delay' '100')
```
