

Select operator

The select operator filters the incoming data stream according to the given predicate.

Parameter

- `predicate`: The predicate to evaluate over each incoming tuple
- `heartbeatrate`: The operator can send a heart beat for filtered element. Use this value to set the rate at which elements are send (1 means: Send a heartbeat for every element that is removed from the stream, i.e. the predicate is false)

Example

PQL

Select Operator

```
output = SELECT({  
    predicate='price > 100'  
}, input)
```

CQL

Select Operator

```
SELECT * FROM input WHERE price > 100
```
