

# ContextEnrich operator

This operator enriches tuples with information from the context store. Further Information can be found [here](#). There is also an DBENRICH operator for fetching data from a database or a simple ENRICH that caches incoming streams.

## Parameter

- **ATTRIBUTES**: The attributes from the store object, that should be used for enrichment
- **STORE**: The name of the store
- **OUTER**: Enriches with <null>, if the store is empty or (when outer is false) the input is discarded.

## Example

### Enrich Operator

```
output = CONTEXTENRICH({store='StoreName', outer='true'}, input)
```
