Text protocol handler

This handler can be used to identify elements in a character stream where a distinct delimiter is used to separate the objects. The whole object is send to the data handler.

Options

- `Delimiter`: The delimiter that should be used to separate the object
- `KeepDelimiter`: A flag that indicates if the delimiter should be part of the result send to the data handler or not
- `Charset`: The Java char set that should be used to decode the input (e.g. "utf-8").
