

ElementWindow

This window creates a new element based window.

Parameter

- `size`: The size of the window, i.e. how many elements form a window
- `advance`: The advance after how many elements the window moves forward. Default advance is 1, i.e. with every new element
- `slide`: The slide of the window. When using this parameter **all elements in the windows will have the same starttimestamp** (e.g. helpful for aggregations), while advance will not change the starttimestamp.
- `partition`: The partition attribute of the window. When using this parameter, the window guarantees to be opened until size element for this group are read.

Remark: The element window blocks until it reads at least size elements.

Example

```
/// a 5 element big window (creating a sliding window)
output = ELEMENTWINDOW({size = 5}, input)

/// a 5 element big window that moves every 5 element (creating windows with disjunct content) partitioned over
the bidder
output = ELEMENTWINDOW({
    size = 5,
    advance = 5,
    partition=['bidder']
}, input)
```
